

For Immediate Release:

AGREM LLC and GeoLogic Computer Systems, Inc. are pleased to announce the formation of a new distribution agreement between their companies. This agreement creates the premier water management software with the goal of developing a seamless transition from survey to design to installation and, finally to analysis. AGREM brings their state of the art SDS tile design software and their design expertise for customer designs. GeoLogic brings their topo collection and machine control software, GCS:Topo and GCS:Pipe, to collect the elevation data and then take the design from AGREM SDS tile design software into GCS:Pipe for installation.

The cooperation between AGREM and Geologic means an end to end solution for the water management market, with professional advice, guidance, training and support throughout the process. Both companies have further invested in remote support tools, which allow direct support in the cab, in the field, in the middle of a job. The customer likely would have never experienced this level of support before. There will be no better product support than a tech with you in the cab or on your design computer. This arrangement brings the two companies that inspired the industry together to offer a turn-key solution to the water management market.

Robert Meiners of AGREM LLC says “since 1993 AGREM has focused on the quality and ease of designing drainage and water management systems. Working with Geologic, who has been in the industry about as long as we have, allows us to work with some real experts on RTK machine control to provide even better water management solutions to our clients.”

Chuck Julian of GeoLogic Computer Systems, Inc. had this to say about the agreement. “We are excited to re-launch GCS:Pipe in partnership with AGREM. AGREM’s sophisticated tiling design software compliments GeoLogic’s industry-leading machine control and offers our customers a complete software and service solution for tile design, suitable for the professional and farmer alike.”
